

Software and Workflow for Reproducible Research

Discussion

Garret Christensen¹

¹UC Berkeley: Berkely Initiative for Transparency in the Social Sciences
Berkeley Institute for Data Science

APHRC, Summer 2015

Outline

BERKELEY INITIATIVE FOR TRANSPARENCY
IN THE SOCIAL SCIENCES

Software and
Workflow

Christensen

- What are problems associated with reproducibility?
- What are solutions to these problems?
- **What are practical tools to implement these solutions?**

- Publication bias (see previous talk)
- Specification Searching (see previous talk)
- Data not available
- Code not available/unintelligible
- Code and data cannot reproduce original results

Irreproducible Workflow

Software and
Workflow

Christensen

- Even with the original authors' help, you can't get the data to reproduce the published results. Or you just can't find the data to begin with.
- *Journal of Money, Credit, and Banking* Project. (Dewald et al., AER 1986)
- Martin Feldstein on Social Security and private savings, Reinhart and Rogoff on debt and GDP growth.

- Study Registry (see previous talk)
- Pre-Analysis Plan (see previous talk)
- Reproducible Workflow

- Study Registry (see previous talk)
- Pre-Analysis Plan (see previous talk)
- Reproducible Workflow

- Study Registry (see previous talk)

Reproducible Workflow

Software and
Workflow

Christensen

- Literate Programing
- Version control with Github or OSF.
- R Markdown and R Studio to write dynamic documents.
- Data Sharing
 - Harvard's Dataverse

- First, *programming* is key to reproducibility. Working in Excel is not reproducible.
- See Reinhart and Rogoff “Growth in a Time of Debt” controversy:
 - Original Paper, *AER P & P* 2010
 - Herndon et. al (2013) finding.
 - *New Yorker* summary.
- Random number generation in Excel: set seed with Data Analysis Toolpak.

- If you are using SPSS, use of ‘syntax’ to record all the commands you run is simple. (See UCLA tutorial.) Similarly in Stata, ‘commandlog’.
- Better is to write scripts. R, Stata, SAS, Python, or whatever you please.
- Open source has some advantages (being free, for one) but you’re going to use what everyone in your field uses.

- Second, *literate programming* is key to reproducibility. Write code to be read by a human being, with the code for the computer secondary.

“I believe that the time is ripe for significantly better documentation of programs, and that we can best achieve this by considering programs to be works of literature. Hence, my title: “Literate Programming.”

Let us change our traditional attitude to the construction of programs: Instead of imagining that our main task is to instruct a computer what to do, let us concentrate rather on explaining to human beings what we want a computer to do.

(cont.)

“The practitioner of literate programming can be regarded as an essayist, whose main concern is with exposition and excellence of style. Such an author, with thesaurus in hand, chooses the names of variables carefully and explains what each variable means. He or she strives for a program that is comprehensible because its concepts have been introduced in an order that is best for human understanding, using a mixture of formal and informal methods that reinforce each other.”

—Donald Knuth *The Computer Journal*, 1984 [Quotes](#) [Original](#)

Version Control

Software and
Workflow

Christensen

- Using version control (AKA revision control) can help to make your work more reproducible.
- What is version control?

Version control is a system that records changes to a file or set of files over time so that you can recall specific versions later. For the examples in this book you will use software source code as the files being version controlled, though in reality you can do this with nearly any type of file on a computer.

—Git, About Version Control

For the examples in this book you will use software source code as the files being version controlled, though in reality you can do this with nearly any type of file on a computer.

–Git, About Version Control

With version control you can:

- Collaborate
- Track who made every change
- Easily switch between versions of files
- Compare versions of files
- Backup
- Work with the same files on different machines
- Experiment with a new version of code without breaking things

Version Control

Software and
Workflow

Christensen

Places you're already using version control without knowing it:

- Google Docs
- Wikipedia
- Every piece of software you use.

Isn't this just a complicated version of the “date and initial” method?

- regressions2015.08.24.do
- regressions2015.08.25.do
- regressions2015.08.25GC.do
- Hassle
- Confusion

Version Control

Software and
Workflow

Christensen

Here is a good rule of thumb: If you are trying to solve a problem, and there are multi-billion dollar firms whose entire business model depends on solving the same problem, and there are whole courses at your university devoted to how to solve that problem, you might want to figure out what the experts do and see if you can't learn something from it.

...

Not one piece of commercial software you have on your PC, your phone, your tablet, your car, or any other modern computing device was written with the “date and initial” method.

—Matthew Gentzkow and Jesse M. Shapiro “Code and Data for the Social Sciences: A Practitioner’s Guide”

Dynamic Documents

Software and
Workflow

Christensen

- Even if you write perfect (version controlled) code, you can still run into problems going from your code to paper. This is where *dynamic documents* come in.
- A dynamic document includes your data, code, analysis, and output all in one place. Fully automated, you can guarantee no mistakes from copying and pasting.
- Do this with R Markdown in R Studio or Ketchup in Stata.

Dynamic Documents

Software and
Workflow

Christensen

- Include tables by linking to a file, instead of a static image.
- Include number by linking to a value calculated by an analysis file, instead of a static number typed manually.
- Automatically update tables and numbers.
- Produce entire paper with one or two clicks.

Examples
